

**Open Science in Agricultural Economics:
Promoting Replicability, Reproducibility, and Transparency in Research**

Revised Project Description

Agricultural and applied economists (AAE) play a key role in delivering information and insight that contributes to policy in agriculture, the environment, and development. The success of these policies depends on the quality and transparency of the underlying research. However, standard MSc and PhD curricula in the field do not cover many of the best practices related to open science.

With this project, we will develop materials, which will be used as part of a virtual workshop on transparency, replicability, and reproducibility in AAE research. The workshop will provide participants with an overview of the best practices and applied tools for open science. Materials will be made available via [Open Science Framework](#) and [GitHub](#).

This work made possible through the Berkeley Initiative for Transparency in the Social Sciences (BITSS), managed by the Center for Effective Global Action (CEGA).
